1.Difference between getElementById(), getElementsByClassName() and getElementsByTagName()

Method	**Selects by**	**Returns**	**Example**
getElementById()	ID	**One element**	document.getElementById("demo")
getElementsByClassName()	Class name	**HTMLCollection**	document.getElementsByClassName("box")
getElementsByTagName()	Tag name	**HTMLCollection**	document.getElementsByTagName("p")

1. getElementById()

Used to select **one element** using its unique id.

```
let element = document.getElementById("demo");
console.log(element);
```

HTML:

```
<p id="demo">Hello</p>
```

2. getElementsByClassName()

Used to select **multiple elements** having the same class.

```
let elements = document.getElementsByClassName("box");
console.log(elements);
```

HTML:

```
<div class="box">One</div>
<div class="box">Two</div>
```

3. getElementsByTagName()

Used to select **all elements with a particular HTML tag**.

let paragraphs = document.getElementsByTagName("p");

console.log(paragraphs);

HTML:

First

Second

In short:

getElementById() → **one element by ID**
getElementsByClassName() → **multiple elements by class**
getElementsByTagName() → **multiple elements by tag**
